Contents

3 Introduction

The following document details the Module Interface Specifications for CRLP (Concrete Remaining Life Perdiction)

Complementary documents include the System Requirement Specifications and Module Guide . The full documentation and implementation can be found at GitHub repository

4 Notation

The structure of the MIS for modules comes from Hoffman and Strooper (1995), with the addition that template modules have been adapted from Ghezzi et al. (2003). The mathematical notation comes from Chapter 3 of Hoffman and Strooper (1995). For instance, the symbol := is used for a multiple assignment statement and conditional rules follow the form $(c_1 \Rightarrow r_1|c_2 \Rightarrow r_2|...|c_n \Rightarrow r_n)$.

The following table summarizes the primitive data types used by CRLP.

Data Type	Notation	Description
character	char	a single symbol or digit
integer	$\mathbb{Z}$	a number without a fractional component in (-∞, ∞)
natural number	$\mathbb{N}$	a number without a fractional component in [1, ∞)
real	$\mathbb{R}$	any number in (-∞, ∞)

The specification of CRLP uses some derived data types: sequences, strings, and tuples. Sequences are lists filled with elements of the same data type. Strings are sequences of characters. Tuples contain a list of values, potentially of different types. In addition, CRLP uses functions, which are defined by the data types of their inputs and outputs. Local functions are described by giving their type signature followed by their specification.

5 Module Decomposition

The following table is taken directly from the Module Guide document for this project.

Level 1	**Level 2**
Hardware-Hiding Module	
Behaviour-Hiding Module	Input Parameters Module Input Format Module Output Format Module Control Module Prediction Calculate Equations Module
Software Decision Module	Sequence Data Structure Module

Table 1: Module Hierarchy

6 MIS of Control Module

The module provides the main program and GUI to call other modules.

6.1 Module

main

6.2 Uses

- Input Parameters Module
- Input Format Module
- Output Format Module
- Prediction Calculate Equations Module

6.3 Syntax

6.3.1 Exported Constants

6.3.2 Exported Access Programs

Name	In	Out	Exceptions
main	-	-	-

6.4 Semantics

6.4.1 State Variables

None

6.4.2 Environment Variables

None

6.4.3 Assumptions

None

6.4.4 Access Routine Semantics

main():

- transition: Interact with the GUI and control other modules by following these steps:
  - The necessary data is input by conducting the Input Parameters Module (M2).
  - The Input Format Module (M3) converts the input data into the data structure.
  - Once the verified data is obtained, the Prediction Calculate Equations Module (M6) begins the calculation process.
  - The result is then returned by the Output Format Module (M4).

- output: None
- exception: The exceptions are listed in corresponding submodules.

6.4.5 Local Functions

None

7 MIS of Input Format Module

The module converts the input data into the data structure utilized by the input parameters module.

7.1 Module

format_input

7.2 Uses

- Input Parameters Module

7.3 Syntax

7.3.1 Exported Constants

7.3.2 Exported Access Programs

Name	In	Out	Exceptions
input_SourceVerify	-	boolean	input_DataSourceError
input_Verify	String, $\mathbb{R}$	$\mathbb{R}$	input_FormatError

7.4 Semantics

7.4.1 State Variables

IsSourceExist: Boolean # Ensure that the necessary columns of data exist on the Government of Canada website.

7.4.2 Environment Variables

Data source: When conducting the prediction process using weather data, the script retrieves data from the Government of Canada website.

7.4.3 Assumptions

None

7.4.4 Access Routine Semantics

input_Verify():

- transition: The following steps are used to load, verify, and store the input data: -
- output: None
- exception: The exceptions are listed in corresponding submodules.

7.4.5 Local Functions

None

8 MIS of Input Parameters Module

The module stores the parameters necessary for CRLP, including concrete properties and weather conditions.

8.1 Module

parameters

8.2 Uses

- Hardware-Hiding Module

8.3 Syntax

8.3.1 Exported Constants

None

8.3.2 Exported Access Programs

Name	In	Out	Exceptions
parameters	-	-	-

8.4 Semantics

The parameters data structure is utilized to store the input data passed by the Input Format Module.

8.4.1 State Variables

The following theories are retrieved from section 4.1.1 of the VnVPlan document Chen (2024), which aims to identify the symbols used in each equation.

1. Theory 1
   C_{const} (constant chloride concentration at the concrete surface): $\mathbb{N}$
   C_x (chloride concentration at depth x): $\mathbb{R}$
   D_{cl} (chloride ion diffusion coefficient): $\mathbb{R}$
   x (depth): $\mathbb{R}$

2. Theory 2
   L (remaining uncarbonated cover): $\mathbb{R}$
   R_c (rate of carbonation): $\mathbb{R}$

3. Theory 3
   k_a (coefficient of active corrosion): $\mathbb{R}$
   k_c (quality coefficient of concrete): $\mathbb{R}$
   k_e (coefficient of environment): $\mathbb{R}$
   C_R (thickness of concrete cover): $\mathbb{R}$

4. Theory 4
   M_{70} (months that relative humidity below 70%): $\mathbb{Z}$
   M_{100} (months that relative humidity between 70% and 100 %): $\mathbb{Z}$
   M_{rain} (months that rain occurs): $\mathbb{Z}$

5. Theory 5
   A_d (cumulative depth of deterioration after t_{use} years): $\mathbb{N}$
   A_{df} (concrete cover thickness after t_{use} years): $\mathbb{N}$
   k_d (constant encapsulates various factors affecting the degradation of concrete): $\mathbb{N}$
   n (time order): $\mathbb{R}$

8.4.2 Environment Variables

Keyboard: The hardware component used for input. This module assumes the presence of a keyboard for data entry.

8.4.3 Assumptions

None

8.4.4 Access Routine Semantics

parameters():

- transition: This module contains a data structure for storing the input values formatted by the Input Format Module.
- output: None
- exception: None

8.4.5 Local Functions

None
