February 26	2.0	Updates Following Feedback

# 1 Reference Material

This section records information for easy reference.

## 1.1 Table of Units

Throughout this document SI (Système International d'Unités) is employed as the unit system. In addition to the basic units, several derived units are used as described below. For each unit, the symbol is given followed by a description of the unit and the SI name.

symbol	unit	SI
A	electric current	ampere
°C	temperature	centigrade
m	length	metre
μ	micro	10 <sup>-6</sup>
Pa	pressure	pascal
s	time	second

## 1.2 Table of Symbols

The table that follows summarizes the symbols used in this document along with their units. The choice of symbols was made to be consistent with the heat transfer literature and with existing documentation for solar water heating systems. The symbols are listed in alphabetical order.

symbol	unit	description
$A_{cr}$	μA/cm <sup>2</sup>	Average corrosion rate of a year
$A_d$	mm	Accumulated deterioration at time $t_y$
$A_{df}$	mm	Amount of damage at failure
$C(x, t)$	%	The chloride concentration at depth x after time t
$C_o$	%	Constant chloride concentration at the surface
$C_R$	cm	Thickness of concrete cover
$C_1$	-	Coefficient weighing the impact of corrosion rates (Icorr) in $M_1$
$C_2$	-	Coefficient weighing the impact of corrosion rates (Icorr) in $M_2$
$C_3$	-	Coefficient weighing the impact of corrosion rates (Icorr) in $M_3$
$D_{cl}$	-	Chloride ion diffusion coefficient
$erf$	-	error function
$H_r$	%	Relative humidity

$I_{\text{corr}}$	-	Corrosion Rates ( )
$k_a$	-	Coefficient of active corrosion
$k_c$	-	Quality coefficient of concrete
$k_d$	mm/year	Factors influencing deterioration at time $t_y$
$k_e$	-	Coefficient of environment
$L$	cm	The remaining uncarbonated cover
$M_1$	month	Number of months that relative humidity is below 70%
$M_2$	month	Number of months that relative humidity is between 70 and 100%
$M_3$	month	Number of months that rain occurs
$n$	year	Time order
$R_c$	cm/year	rate of carbonation
$R_d$	m/s	Rate of concrete degradation
$t$	year	The time required to reach a sufficient depth x to obtain complete chloride concentration
$t_c$	year	The time to be fully covered by carbonation
$t_i$	year	Age of the concrete at the time of condition inspection
$t_r$	year	Remaining service life of concrete
$t_y$	year	Service life of concrete
$t_f$	year	Time to failure
$x$	m	Depth of chloride concentration

---

## 1.3 Abbreviations and Acronyms

symbol	description
A	Assumption
DD	Data Definition
GD	General Definition
GS	Goal Statement
Icorr	Corrosion rates
IM	Instance Model
LC	Likely Change
PS	Physical System Description
R	Requirement
RH	Relative humidity
SRS	Software Requirements Specification
TM	Theoretical Model
UI	User Interface

## 2 Introduction

In response to the critical need for predicting the remaining life of concrete structures, this project aims to develop a program that implements theories introduced by a United States laboratory in 1992. Their work emphasized the importance of estimating remaining service life to enable property owners to plan for repairs or demolitions proactively. By predicting the remaining service life of concrete structures, it offers a valuable tool for effective maintenance and decision-making.

The upcoming section will present a roadmap for the Software Requirements Specification (SRS) of the program. This segment elucidates the document's purpose, outlines the scope of the requirements, and describes the characteristics of the target audience for this document.

### 2.1 Purpose of Document

The primary aim of this document is to outline the requirements of the Concrete Remaining Life Prediction program. This encompasses background information, goals, assumptions, theoretical models, definitions, and other details related to model derivation. These components collectively enable the audience to gain a clear understanding and verify the purpose and scientific basis of this program.

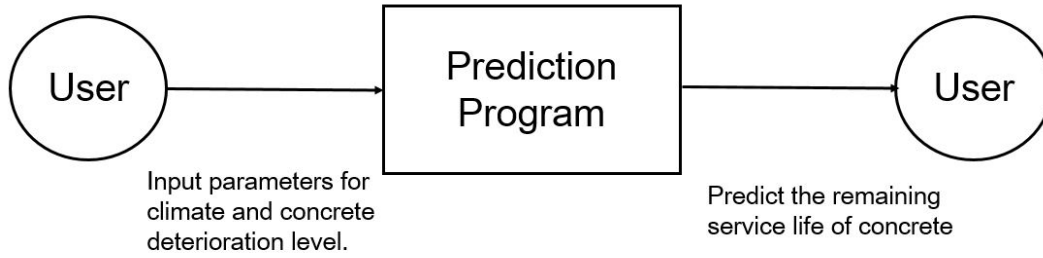

Figure 1: System Context

## 2.2 Scope of Requirements

This document explores the impact of climate data and the level of concrete deterioration (e.g., carbonation model) on concrete structures, aiming to implement a predictive program.

## 2.3 Characteristics of Intended Reader

The intended reviewers of this documentation should possess an understanding of meteorology or civil engineering. Additionally, a basic grasp of high-school level mathematics and chemistry is recommended. For users of the prediction program can have a lower level of expertise, as further explained in the “User Characteristics” section (Section 3.2).

## 2.4 Organization of Document

The organization of this document follows the SRS template provided by Dr. Smith and the GlassBR SRS document(1).

# 3 General System Description

This section provides general information about the system. It identifies the interfaces between the system and its environment, describes the user characteristics and lists the system constraints.

## 3.1 System Context

Figure 1 illustrates the system context. In this representation, a circle signifies an external entity, which, in this case, is the user. The rectangle represents the prediction program, and arrows depict the data flow between the system and its environment.

The interaction between the product and the user is through a UI. The responsibilities of the user and the system are as follows:

- User Responsibilities: Provide the input data related to climate and concrete deterioration level.
- Prediction Program Responsibilities: Determine if the inputs satisfy the required program constraints and predict the remaining service life of concrete.

### **3.2 User Characteristics**

- The end user is expected to possess basic computer literacy for effectively handling the software.
- The end user is expected to have an understanding of the theory behind concrete degradation measurement and its root causes.

### **3.3 System Constraints**

There are no system constraints.

## **4 Specific System Description**

This section first presents the problem description, which gives a high-level view of the problem to be solved. This is followed by the solution characteristics specification, which presents the assumptions, theories, definitions and finally the instance models.

### **4.1 Problem Description**

A system is required to predict the remaining service life of concrete by integrating climate data and concrete degradation levels.

#### **4.1.1 Terminology and Definitions**

This subsection provides a list of terms that are used in the subsequent sections and their meaning, with the purpose of reducing ambiguity and making it easier to correctly understand the requirements:

1. Corrosion rates ( $I_{corr}$ ): The flow of electric charge associated with the corrosion reactions occurring on a metal surface.
2. Deterioration Factors:
  - Carbonation
  - Diffusion of chloride ions

- Acid attack (siliceous aggregate)
  - Acid attack (carbonate aggregate)
  - Sulfate attack
  - Frost attack
  - Active corrosion of steel
  - Reinforcement (propagation)
3. Rain: Precipitation in the form of liquid water droplets greater than 0.5 mm.
  4. Relative Humidity: Relative humidity in percent (%) is the ratio of the quantity of water vapour the air contains compared to the maximum amount it can hold at that particular temperature.

#### 4.1.2 Physical System Description

The physical system regarding how deterioration occurs is not discussed in this study.

#### 4.1.3 Goal Statements

Develop a prediction program that implements the theories, with the goal of predicting the remaining service life of concrete structures.

### 4.2 Solution Characteristics Specification

The instance models that govern this program are presented in Subsection 4.2.5. The information to understand the meaning of the instance models and their derivation is also presented, so that the instance models can be verified.

#### 4.2.1 Assumptions

This section simplifies the original problem and helps in developing the theoretical model by filling in the missing information for the physical system. The numbers given in the square brackets refer to the theoretical model [TM], general definition [GD], data definition [DD], instance model [IM], or likely change [LC], in which the respective assumption is used.

- A1: The values of  $k_d$  remain constant throughout the entire deterioration period.
- A2: The factors influencing the remaining life of concrete and causing degradation are restricted to the following: carbonation, diffusion of chloride ions, acid attack (siliceous aggregate), acid attack (carbonate aggregate), sulfate attack, frost attack, active corrosion of steel and reinforcement (propagation).

- A3: If only one degradation process occurs, implicitly refer to [Figure 4](#) to determine the exact value of  $n$ ; Multiple degradation processes occurring simultaneously, making the time order  $n=1$ .
- A4: When using weather data to predict results, relative humidity is considered the only factor that influences  $I_{corr}$ .
- A5: The relative humidity value needs to remain consistently below 70% for a month to be considered in the calculation of the  $M_1$  value. The same applies to the  $M_2$  and  $M_3$  values.
- A6: The relationship between  $M_1$  and  $M_2$  is mutually exclusive to  $M_3$ . In other words, there is no rain during the  $M_1$  and  $M_2$  periods.

#### 4.2.2 Theoretical Models

There are no theoretical models.

#### 4.2.3 General Definitions

There are no general definitions.

#### 4.2.4 Data Definitions

This section collects and defines all the data needed to build the instance models. The dimension of each quantity is also given.

Number	DD1
Label	Coefficient weighing the impact of corrosion rates ( $I_{corr}$ ) in $M$
Symbol	$M_1, M_2, M_3, C_1, C_2, C_3$
SI Units	-
Equation	$\begin{cases} M_1, C_1 = 0.1 \\ M_2, C_2 = 1.0 \\ M_3, C_3 = 10 \end{cases}$
Description	The coefficient for $M_1$ will be 0.1, for $M_2$ it will be 1.0, and for $M_3$ it will be 10.
Sources	James Clifton et al. ( <a href="#">1</a> )
Ref. By	IM??

Number	DD2
Label	Average corrosion rate of year
Symbol	$A_{cr}$
SI Units	-
Equation	$A_{cr} = \frac{C_1 \cdot M_1 + C_2 \cdot M_2 + C_3 \cdot M_3}{12}$
Description	<p><math>M_1</math> is month Number of months that relative humidity is below 70%</p> <p><math>M_2</math> is month Number of months that relative humidity is between 70 and 100%</p> <p><math>M_3</math> is month Number of months that rain occurs</p> <p><math>C_1</math> is coefficient weighing the impact of corrosion rates (Icorr) in <math>M_1</math></p> <p><math>C_2</math> is coefficient weighing the impact of corrosion rates (Icorr) in <math>M_2</math></p> <p><math>C_3</math> is coefficient weighing the impact of corrosion rates (Icorr) in <math>M_3</math></p>
Sources	James Clifton et al. (1)
Ref. By	IM??

Number	DD3
Label	Amount of concrete degradation
Symbol	$k_d, A_d, t_y, n$
SI Units	s
Equation	$k_d = \left( \frac{A_d}{t_y} \right)^n$
Description	<p><math>A_d</math> is Accumulated deterioration at time <math>t_y</math>.</p> <p><math>k_d</math> is Factors influencing deterioration.</p> <p><math>t_y</math> is Service life of concrete.</p> <p><math>n</math> is time order</p> <p>The above equation calculate the amount of concrete degradation.</p>
Sources	James Clifton et al. (1)
Ref. By	IM??

Number	DD4
Label	<b>Time to failure</b>
Symbol	$t_y, A_{df}, k_d, n$
SI Units	s
Equation	$t_y = \left( \frac{A_{df}}{k_d} \right)^{\frac{1}{n}}$
Description	<p><math>t_y</math> is Service life of concrete</p> <p><math>A_d</math> is the amount of damage at failure</p> <p><math>k_d</math> is the factor influencing deterioration</p> <p><math>n</math> is the time order</p> <p>The above equation calculates the time to failure</p>
Sources	James Clifton et al. (1)
Ref. By	IM??

#### 4.2.5 Instance Models

This section transforms the problem defined in Section 4.1 into one which is expressed in mathematical terms. It uses concrete symbols defined in Section 4.2.4 to replace the abstract symbols in the models identified in Sections 4.2.2 and 4.2.3.

Number	IM1
Label	<b>By using chloride concentration at depth x to derive time t</b>
Input	$C_o$ , erf, x, $D_{cl}$ , t
Output	C(x,t)
Description	<p><math>C_o</math> is constant chloride concentration at the surface.</p> <p>erf is the error function.</p> <p>x is the depth of chloride concentration.</p> <p><math>D_{cl}</math> is Chloride ion diffusion coefficient.</p> <p>t is the time required to reach a sufficient depth x to obtain complete chloride concentration.</p> <p>The above equation the time t to reach depth x can be used to derive the remaining service life.</p>
Sources	James Clifton et al. (1)
Ref. By	-

Number	IM2
Label	<b>Predict remaining service life of carbonation model</b>
Input	L, x, $R_c$
Output	$t_c$
Description	<p><math>t_c</math> is the time to be fully covered by carbonation.</p> <p>L is the the remaining uncarbonated cover.</p> <p><math>D_{cl}</math> is Chloride ion diffusion coefficient.</p> <p><math>R_c</math> is the rate of carbonation.</p> <p>The above equation predict remaining service life of carbonation model.</p>
Sources	James Clifton et al. (1)
Ref. By	-

Number	IM3
Label	<b>Prediction of remaining service life with respect to chloride attack</b>
Input	$k_c, k_e, CR, k_a$
Output	$t_r$
Description	<p><math>t_r</math> is the remaining service life of concrete.</p> <p><math>k_c</math> is the quality coefficient of concrete.</p> <p><math>k_e</math> is the coefficient of environment.</p> <p>CR is the thickness of concrete cove.</p> <p><math>k_a</math> is the coefficient of active corrosion.</p> <p>The above equation prediction of remaining service life with respect to chloride attack.</p>
Sources	James Clifton et al. (1)
Ref. By	-

Number	IM4
Label	<b>Prediction of remaining service life with weather data</b>
Input	$A_{cr}$
Output	$t_r$
Description	<p><math>t_r</math> is the remaining service life of concrete.</p> <p><math>A_{cr}</math> is the average corrosion rate of a year.</p> <p>The above equation predicts the remaining service life with weather data.</p>
Sources	James Clifton et al. (1)
Ref. By	-

Number	IM5
Label	<b>Predict the remaining service life based on the age at failure up to the time of inspection</b>
Input	$t_f, t_i$
Output	$t_r$
Description	$t_r$ is the remaining service life of concrete. $t_f$ is the average corrosion rate of a year. $t_i$ is the age of the concrete at the time of condition inspection. The above equation predict the remaining service life based on the age at failure up to the time of inspection.
Sources	James Clifton et al. (1)
Ref. By	-

#### 4.2.6 Input Data Constraints

There are no constraints regarding input variables or specification parameter values.

#### 4.2.7 Properties of a Correct Solution

There are no constraints regarding output variables.

## 5 Requirements

This section provides the functional requirements, the business tasks that the software is expected to complete, and the nonfunctional requirements, the qualities that the software is expected to exhibit.

### 5.1 Functional Requirements

R1: Input the weather data and concrete degradation data.

R2: Output the prediction result.

R3: Utilize the input from the previous step to calculate the average corrosion rate and time to failure for the concrete.

R4: Verify that the output result is generated from the input data.

## 5.2 Nonfunctional Requirements

- NFR1: **Usability** With the UI, users are able to input data and generate output effortlessly.
- NFR2: **Accuracy** With the given input, the system is capable of generating accurate results.
- NFR3: **Reusable** The code is modularized and flexible to extend functions.

## 6 Likely Changes

- LC1: The **Assumption 1** restricts the category of degradations that might be experienced in the future.
- LC2: The **Assumption 4.2.5** restricts the weather factor to only be  $R_h$  that might be experienced in the future.

## 7 Unlikely Changes

- UL3: The **Assumption 5** is fixed and unlikely to change.

## 8 Traceability Matrices and Graphs

The purpose of the traceability matrices is to provide easy references on what has to be additionally modified if a certain component is changed. Every time a component is changed, the items in the column of that component that are marked with an “X” may have to be modified as well. Table ?? shows the dependencies of theoretical models, general definitions, data definitions, and instance models with each other. Table 3 shows the dependencies of instance models, requirements, and data constraints on each other. Table 1 shows the dependencies of theoretical models, general definitions, data definitions, instance models, and likely changes on the assumptions.
